Log Analysis – Task 13

REPORT ID	AZ-WEB-2026-013
VERSION	1.0
ASSESSMENT DATE	13/9/2026
REPORT DATE	13/9/2026
PREPARED BY	Ammar Alzaiem
CLASSIFICATION	Public

Web Log Analysis

The Apache access logs were reviewed to identify client IP addresses, HTTP methods, requested paths, status codes, and User-Agent strings.

The main client was 192.168.56.1, using Chrome on Linux. Most requests returned 200 OK, while 302 responses were observed during normal DVWA redirects and login activity.

Repeated requests were identified for /dvwa/vulnerabilities/exec/ and /dvwa/login.php. These were considered repeated activity but were consistent with normal testing of the DVWA application.

Two 404 Not Found responses were observed for /favicon.ico and /dvwa/dashboard.php. The favicon request is likely normal browser behavior, while the request for /dvwa/dashboard.php was flagged for review because the requested resource does not exist.

An OPTIONS * request from 127.0.0.1 with the Apache internal dummy connection User-Agent was also observed. This was identified as an internal Apache request rather than suspicious external activity.

Overall, the log analysis demonstrated how web logs can be used to identify normal requests, repeated activity, and unusual HTTP status codes.
